

Central Office

Fiber Distribution Management System Central Office

Usually located within a central office or hub, FDMS act as an the open interface between the outside plant and active electronics. The distribution frame serves as a fiber management system that combines all interconnection functions such as patching, splicing and slack storage. Such a piece of equipment is crucial to effective management of circuits and shared networks. Choosing the right distribution frame can ease both installation and long term system maintenance.

Teracom Fiber Distribution management System is fully customizable to suit diverse needs of network management, and features exceptional connection density within a small footprint.

Features	Benefits
▫ High Density	Up to 288 connections.
▫ Easy to assemble and install	Saves time.
▫ Front and rear cable entry	Provide convenient fiber management routes for patchcords and incoming cable.
▫ Modular Design	Combine patchcord and splice functions within a single frame.
▫ Universal Design	Suitable for fiber as well as ribbon.
